Chapter 3

4.

4. Rewrite the BNF of Example 3.4 to add the ++ and -- unary operators of Java.

$\langle \text{assign} \rangle \rightarrow \langle \text{id} \rangle = \langle \text{expr} \rangle$

$\langle \text{id} \rangle \rightarrow A \mid B \mid C$

$\langle \text{expr} \rangle \rightarrow \langle \text{expr} \rangle + \langle \text{term} \rangle \mid \langle \text{term} \rangle$

$\langle \text{term} \rangle \rightarrow \langle \text{term} \rangle * \langle \text{factor} \rangle \mid \langle \text{factor} \rangle$

$\langle \text{factor} \rangle \rightarrow (\langle \text{expr} \rangle) \mid \langle \text{id} \rangle \mid \langle \text{id} \rangle ++ \mid \langle \text{id} \rangle --$

11.

11. Consider the following grammar:

$\langle S \rangle \rightarrow \langle A \rangle a \langle B \rangle b$

$\langle A \rangle \rightarrow \langle A \rangle b \mid b$

$\langle B \rangle \rightarrow b$

Which of the following sentences are in the language generated by this grammar?

a. babb

b. bbbabb

c. bbaaaaabc

d. aaaaaa

a & b

$\langle S \rangle \rightarrow \langle A \rangle a \langle B \rangle b$

➔ babb

$\langle S \rangle \rightarrow \langle A \rangle a \langle B \rangle b$

➔ $\langle A \rangle$ babb

- ➔ <A>bbabb
- ➔ bbbabb

21.

21. Using the virtual machine instructions given in Section 3.5.1.1, give an operational semantic definition of the following:
- a. Java **do-while**
 - b. Ada **for**
 - c. C++ **if-then-else**
 - d. C **for**
 - e. C **switch**

Java Do-while

do { statements} while (expr);

Operational Semantic:

L1:

...

Statements

...

If (expr == True) goto L1

...

Ada for loop

For var in A .. B loop

Statements

out loop

Operational Semantic:

var = A

L2:

If (var <= B) goto L1

goto out

L1:

...

Statements

...

Var = var +1

Goto L2

out:

...

C++ if then else

If (expr) {

Statements

}

Else {

Statements

}

Operational Semantic:

If (expr == True) goto L1

Goto L2

L1:

...

Statements

...

Goto out

L2:

...

Statements

...

out:

...

C For

For (expr1;expr2;expr3){

 statements

}

Operational Semantic:

expr1

L2:

If (expr2 == True) goto L1

goto out

L1:

...

statements

...

expr3

goto L2

out:

...

C switch

Switch (A) {

 case c1 : S1

 case c2: S2

```
...  
    Case cn: SN  
    <default>  
}
```

Operational Semantic:

If (A == c1) goto C1

If (A == c2) goto C2

...

If (A == cn) goto CN

goto out

C1: S1

C2: S2

...

CN: SN

out:

...
